

Functional architecture

Nine verticals, sequenced — not designed as if they ship together. Status is against the working system, not the roadmap.

The organising principle, in the founder's words. A doctor should be looking at the patient, not the screen; a retailer should be looking at the customer, not the gadget. Every module below is judged by whether it takes attention away from the counter. That is why voice is the interaction model rather than a feature, and why the analytics layer is **not** a dashboard — a shop owner who has neither the time nor the training to read one currently outsources understanding of their own business to an auditor once a quarter. Being able to ask the shop a question, in their own language, is the same idea as billing by voice: remove the interface between the owner and their own trade.

INTERACTION — the only layer the shopkeeper meets			
Wake word "Hey Chitti" — hands stay on the goods UNSTABLE	Push-to-talk Hold, speak, release. The fallback that always works BUILT	Spoken confirmation Totals and errors read aloud — nobody is watching the screen BUILT	Touch / type Never the default. Correction and edge cases only BUILT
DOMAIN MODULES — sequenced by tier			
1 · Voice billing core Multi-item in one breath · confidence gate · price-led and quantity-led · combos BUILT · T1	2 · Order management Queues, modifiers, split/merge tickets. F&B depth — deliberately deferred NOT BUILT · T2	3 · Inventory & replenishment Schema exists; no deduction logic. Predictive reorder is T3 NOT BUILT · T2/T3	4 · Analytics & insights Ask in your own language. Promoted to core — see above NOT BUILT · T1
5 · CRM & loyalty Customer identity by spoken number + repeat-basket recall built. Depth comes from RAGaaS PARTIAL · T1	6 · Payments UPI deep link + exact-amount QR; cash settled on the shopkeeper's word. We never hold funds BUILT · T1	7 · Compliance Numbered Bill of Supply, gapless per FY. Tax invoice needs HSN + rate + scheme PARTIAL · T1	8 · Multi-store HQ reporting and control NOT BUILT · T2/T3
9 · Marketplace ONDC, WhatsApp ordering, aggregators NOT BUILT · T2	Receipt & delivery 58mm thermal render, WhatsApp hand-off, print PARTIAL · T1	Catalog & aliases Voice SKU entry; per-shop spoken aliases — the compounding asset BUILT · T1	
DATA — shop-partitioned throughout			
Catalog SKUs, units, prices, aliases BUILT	Bills & receipts Document stored as issued, not recomputed BUILT	Utterance log Transcripts only, never audio. Corrections flagged BUILT	Local-first store Offline billing. The gating dependency NOT BUILT

Built and in use Partial Not built

What the status table actually says

Of nine verticals, **one is complete** (voice billing), three are partial, five are untouched. That is the correct shape for a pre-seed prototype and the deck should present it as deliberate sequencing rather than let it

read as thin coverage. The sequencing logic is: **anything that does not serve a single counter on day one waits.**

Two decisions worth defending

Analytics moves to Tier 1. Conventional sequencing puts dashboards at Tier 2+. The founder's point inverts it: the owner who most needs to understand their own numbers is precisely the one who cannot read a dashboard and cannot afford a consultant. A natural-language question — *"how much did I sell of coffee powder last week"*, asked aloud in Tamil — costs almost nothing to build on top of a schema this small, and is a sharper differentiator than any feature Petpooja has. It is also the only module where an LLM clearly earns its place (see the technical note).

Order management is deferred, not scheduled. Modifiers, KDS and aggregator integration are where Petpooja has a decade of depth. Building toward them means competing on their ground with a tenth of the resources. The beachhead is provision and kirana counters, where order management is one line and a total.

Where RAGaaS attaches

VBS knows **what was sold and to whom**. RAGaaS knows **the conversation with that customer**. The join is the mobile number already captured at the counter — no new identity system, no new data model. That makes module 5 an integration rather than a build, and it is the only reason a solo founder can credibly show a CRM story at all.
