

Business Model Canvas — Bolo Bill

Tiers: **Single** (1 counter) · **Growing** (2–10) · **Chain** (10+). VBS is the wedge; RAGaaS supplies the CRM layer. Solo technical founder, self-funded.

KEY PARTNERS

- **Sarvam AI** — ASR today. A dependency, not a partnership **RISK**
- Thermal printer distributors — curated kit, resold at near cost
- UPI PSPs — collection rails; we never hold funds
- FMCG distributors — the van already visits weekly
- ONDC / DigiDukaan — distribution, not just context
- Android OEM/telco bundles **VALIDATE**

KEY ACTIVITIES

- Driving cost per utterance toward zero — on-device ASR
- Grammar + language packs (data, not code)
- Offline-first rebuild on Android
- Low-touch onboarding that survives no field force
- Silent-error suppression as a standing discipline

KEY RESOURCES

- **Per-shop spoken-alien catalog** — the moat. Each shop teaches it their words; that data does not transfer to a competitor and grows more valuable the longer they stay
- **Corrected-utterance corpus** (opt-in) — the training set for on-device ASR
- The grammar + six language packs
- Founder: builds and sells

VALUE PROPOSITIONS

To the shop

- **Speak instead of type.** Removes the literacy and typing-speed gate on who can staff a counter
- **Near-zero capex** — their phone + a ₹2.5–6k printer
- Six languages, code-mixed, the way people actually speak
- Learns the shop's own words for its own goods
- Faster than paper, or it does not ship

To us

- No hardware to manufacture, stock or warranty
- A correction corpus that compounds with every shop

CUSTOMER RELATIONSHIPS

- Founder-led onboarding while it teaches us something
- Then self-serve: install → first bill under 5 min
- Support in the shop's own language, over WhatsApp
- RAGaaS agent absorbs routine support

CHANNELS

- Design-partner referral inside one street/trade
- Printer dealers & local IT shops — they already sell to this buyer
- FMCG distributor routes
- WhatsApp-led onboarding
- ONDC / DigiDukaan **VALIDATE**

CUSTOMER SEGMENTS

- **Single** — one counter, <200 SKU. Kirana, café, provision. *Ragas Coffee sits here*
- **Growing** — 2–10 outlets, needs sync + CRM
- **Chain** — 10+, HQ reporting, replenishment
- **Beachhead:** shops billing on paper today — not shops replacing a POS

COST STRUCTURE

- **Cloud inference — the line that decides the business.** Today every utterance is a paid cloud ASR call. Ceiling is ₹10/shop/month all-in. At ~24,000 utterances/shop/month this does not close on cloud ASR at any plausible rate; on-device is not an optimisation, it is the business model **VALIDATE**
- Onboarding & support — the real cost at kirana ARPU; must stay near-zero-touch
- Engineering (founder today; ASR/Android hire next)
- Channel commissions · Deliberately zero hardware cost

REVENUE STREAMS

- **Single** ₹199–299/mo **VALIDATE**
- **Growing** ₹1,499–2,999/mo — includes what Petpooja bills as add-ons
- **Chain** ₹7,500+/mo
- Curated printer kit at near cost — adoption lever, not margin
- Add-ons: replenishment, analytics, RAGaaS CRM
- Aggregated insight to brands — opt-in, later, only if it never competes with the shop's own interest

Block-by-block reasoning

Customer segments — the beachhead is paper, not software

The sharpest framing is not "kirana stores". It is **shops that bill on paper today**. A shop already running Vyapar has absorbed the typing cost and has data to migrate; a shop with a calculator and a notebook has neither. Ragas Coffee — 24 SKUs, single counter — is the shape. Tier 1 must cover cafés and kirana alike, which is why the tier is named for its *counter count*, not its trade.

Value propositions — one claim is hard, the rest are projections

The capex comparison is a hard cost fact and survives contact with numbers **if stated carefully** — see the competitive note, where the honest denominator is WeP's ₹9,990 billing machine, not their ₹82,790 terminal bundle. The literacy argument is the one that is genuinely differentiating and genuinely unproven: it predicts that a shop can put someone at the counter who could not have run a typing POS. **Nobody but the founder has yet spoken to this system**. Proving that with one non-founder operator is worth more than any deck slide.

Key resources — where a moat could actually come from

Not the voice technology. Sarvam is a vendor and on-device ASR will commoditise. The defensible asset is the **per-shop alias catalog**: after a month, a shop's system knows that *this* shop's "aloo" is *that* SKU at *that* price. That is switching cost the shop built themselves, and it is invisible to a competitor quoting a lower price. Second is the corrected-utterance corpus — the only realistic route to an on-device model tuned to code-mixed retail speech, which is in turn the only route to ₹0 marginal inference. **The moat and the cost structure are the same asset**. That is the strategic core of this business and the deck should say so.

Cost structure — the number that decides everything

Every other block is ordinary SaaS. This one is not. A ₹199/month subscription leaves roughly ₹150 after platform costs to cover ~24,000 utterances, support and CAC amortisation. No cloud ASR clears that. Three routes exist: on-device ASR (the plan, and what the corpus is for), radically fewer cloud calls (wake-word gating — already the architecture), or a higher entry price (which forfeits the wedge). **An investor who does not probe this is not paying attention; one who does should be met with the roadmap, not a deflection**.

Revenue — and the honest note on data monetisation

Aggregated insight to FMCG brands is the line most likely to be over-promised. It requires scale we do not have, consent we have not designed, and it sits uncomfortably against the shop's own interest — a brand paying for shelf intelligence is not paying to help the shopkeeper negotiate. Keep it as an opt-in option late in the model, never as a load-bearing revenue assumption. **ASSUMPTION — VALIDATE**

Key partners — Sarvam is a dependency, not a partnership

Stated plainly because diligence will: the product's core capability is currently bought from a single vendor at a price that does not close the unit economics. That is acceptable for a prototype and unacceptable as

a destination, which is exactly why on-device ASR is the first funded engineering hire.

Where RAGaaS fits

Per the founder's direction: **VBS is the wedge and owns the counter; RAGaaS supplies the CRM layer.** The clean division is that VBS knows *what was sold and to whom*; RAGaaS knows *the conversation with that customer*. Shared customer identity — the mobile number already captured at the counter — is the join. This is a credible expansion story precisely because it does not require VBS to become a CRM: it requires one integration against a product that already exists. Keep it as a module in the architecture and one slide in the deck, not as the headline.
